DATE MAILED: 07/25/2006

Please find below and/or attached an Office communication concerning this application or proceeding.

<b>Office Action Summary</b>	<b>Application No.</b> 10/670,173	<b>Applicant(s)</b> MOSELLI ET AL.	
	<b>Examiner</b> Jennifer L. Norton	<b>Art Unit</b> 2121	

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

**Period for Reply**

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

**Status**

- 1) ☒ Responsive to communication(s) filed on 12 May 2006.
- 2a) ☐ This action is **FINAL**.                      2b) ☒ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

**Disposition of Claims**

- 4) ☒ Claim(s) 1-3, 5-10, 13-19 and 21-25 is/are pending in the application.
- 4a) Of the above claim(s) \_\_\_\_\_ is/are withdrawn from consideration.
- 5) ☐ Claim(s) \_\_\_\_\_ is/are allowed.
- 6) ☒ Claim(s) 1-3, 5-10, 13-19 and 21-25 is/are rejected.
- 7) ☐ Claim(s) \_\_\_\_\_ is/are objected to.
- 8) ☐ Claim(s) \_\_\_\_\_ are subject to restriction and/or election requirement.

**Application Papers**

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☒ The drawing(s) filed on 26 October 2005 is/are: a) ☒ accepted or b) ☐ objected to by the Examiner.  
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).  
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

**Priority under 35 U.S.C. § 119**

- 12) ☒ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☒ All    b) ☐ Some \*    c) ☐ None of:
1. ☒ Certified copies of the priority documents have been received.
2. ☐ Certified copies of the priority documents have been received in Application No. \_\_\_\_\_.
3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

\* See the attached detailed Office action for a list of the certified copies not received.

### **DETAILED ACTION**

1. The following action is a Non-Final Office action in response to the Request for Continued Examination filed 12 May 2006. Claims 1, 13-14, 18 and 21 have been amended. Claims 22-25 are newly added. Claims 4, 11-12 and 20 have been cancelled. Claims 1-3, 5-10, 13-19 and 21-25 are pending in this application.

### ***Specification***

2. The amendment to the specification was received on 12 May 2006. The correction is acceptable.

### ***Claim Rejections - 35 USC § 112***

3. The amendment to the claims 1, 5, 9 and 18 was received on 12 May 2006. The correction is acceptable.

### ***Claim Rejections - 35 USC § 103***

4. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

Art Unit: 2121

5. Claims 1-3, 5-7, 9-10, 13-19 and 21-25 are rejected under 35 U.S.C. 103(a) as being unpatentable over U.S. Patent No.: 6,582,841 (hereinafter Okamoto) in view of U.S. Patent No. 5,197,114 (hereinafter Sheirik).

6. As per claim 1, Okamoto teaches to an arrangement for controlling a system according to the a deviation between the an actual value measured on the system and the a value estimated by means of a model of the controlled system of at least one control parameter, the arrangement comprising:

a neural network, which generates the an estimation of said control parameter implementing said model as a function of a set of characteristic parameters of the controlled system and of respective configuration parameters of the neural network (col. 8, lines 29-33),

an acquisition module (Fig. 1, element 30, 34, 38 and 40) for acquiring the actual value, as measured on the controlled system (Fig. 1 30a, 34a, 38a, and 40a), of a set of sensing parameters comprising at least one from among said control parameter and said characteristic parameters of the controlled system (col. 4, lines 25-32 and 36-52);

wherein said controlled system comprises at least one fuel cell (col. 4, lines 4-14 and Fig. 1, element 20).

Okamoto does not expressly teach said neural network having associated thereto a training module, which can train said neural network by modifying said configuration parameters according to a set of updating data,

a variation module, which is sensitive to the variation of said control parameter and is able to generate an update-enable signal when said control parameter falls outside a pre-set tolerance range,

said acquisition module being sensitive to said update-enable signal for transferring to said training module, as said updating-data set, said set of sensing parameters,

said at least one control parameter is represented by a voltage generated by said at least one fuel cell, and

wherein said acquisition module comprises a functional module for calculating, according to the value of at least one of said characteristic parameters of the controlled system an address for storing said at least one control parameter.

Sheirik teaches to a training module (Fig. 34), which can train said neural network by modifying said configuration parameters according to a set of updating data (col. 13, lines 1-13 and 24-34),

a variation module (Fig. 34, element 3404), which is sensitive to the variation of said control parameter and is able to generate an update-enable signal (col. 21, lines

Art Unit: 2121

53-57) when said control parameter falls outside a pre-set tolerance range (col. 21, lines 32-39),

said acquisition module being sensitive to said update-enable signal for transferring to said training module, as said updating-data set, said set of sensing parameters (col. 9, lines 12-13),

said at least one control parameter is represented by a voltage (Fig. 20, element 2002) generated by said at least one fuel cell (col. 7, lines 32-34), and

a functional module for calculating, according to the value of at least one of said characteristic parameters of the controlled system an address for storing said at least one control parameter (col. 20, lines 39-61).

The specification does not disclose a definition of the term calculate, the examiner has interpreted the meaning of calculate as "to make for deliberate purpose: design" (The American Heritage College Dictionary, pg. 204). Sheirik teaches to the limitation of calculating, according to the value of at least one of said characteristic parameters of the controlled system an address for storing said at least one control parameter, wherein the user specifies the data storage location for specific data. Accordingly, it is inherent the module will have an analysis/determination component for placing the specific data in the appropriate data storage location as specified by the user.

Therefore, it would have been obvious to a person of ordinary skill in the art at the time of applicant's invention to modify the teaching of Okamoto to include a neural network having associated thereto a training module, which can train said neural network by modifying said configuration parameters according to a set of updating data, a variation module, which is sensitive to the variation of said control parameter and is able to generate an update-enable signal when said control parameter falls outside a pre-set tolerance range, said acquisition module being sensitive to said update-enable signal for transferring to said training module, as said updating-data set, said set of sensing parameters, at least one control parameter is represented by a voltage generated by said at least one fuel cell, and a functional module for calculating, according to the value of at least one of said characteristic parameters of the controlled system an address for storing said at least one control parameter to eliminate a human operator from real time control of the system (abstract and col. 5, lines 50-51), in addition to, it reducing operator error, increasing long-term process control consistency, and eliminating the cost of an operator (col. 9, lines 55-57).

7. As per claim 2, Okamoto does not expressly teach a truncation module for truncating the actual value of at least some of said characteristic parameters of the controlled system.

Sheirik teaches to a truncation module for truncating the actual value of at least some of said characteristic parameters of the controlled system (col. 21, lines 41-43).

Therefore, it would have been obvious to a person of ordinary skill in the art at the time of applicant's invention to modify the teaching of Okamoto to include a truncation module for truncating the actual value of at least some of said characteristic parameters of the controlled system to eliminate a human operator from real time control of the system (abstract and col. 5, lines 50-51), in addition to, reducing operator error, increasing long-term process control consistency, and eliminating the cost of an operator (col. 9, lines 55-57).

8. As per claim 3, Okamoto teaches a memory (Fig. 2A, element A1, A2, A3 and A4 and Fig. 2B, element B1, B2, B3 and B4) for storage of at least one of the parameters of said set of sensing parameters (col. 5, lines 22-31 and col. 10, lines 42-47).

9. As per claim 5, Okamoto does not expressly teach to an input network for verifying whether said actual value, as measured on said controlled system, of at least one of said characteristic parameters of the controlled system falls within an allowed range of variation.

Sheirik teaches to an input network (Fig. 32, element 3212, 3214 and 3216) for verifying whether said actual value, as measured on said controlled system, of at least one of said characteristic parameters of the controlled system falls within an allowed range of variation (col. 21, lines 32-39).

Therefore, it would have been obvious to a person of ordinary skill in the art at the time of applicant's invention to modify the teaching of Okamoto to include an input network for verifying whether said actual value, as measured on said controlled system, of at least one of said characteristic parameters of the controlled system falls within an allowed range of variation to eliminate a human operator from real time control of the system (abstract and col. 5, lines 50-51), in addition to, reducing operator error, increasing long-term process control consistency, and eliminating the cost of an operator (col. 9, lines 55-57).

10. As per claim 6, Okamoto teaches a sample-and-hold module (Fig. 2A, element A1, A2, A3 and A11 and Fig. 2B, element B1, B2, B3, and B11) for acquiring the value of said control parameter (col. 8, lines 16-22).

11. As per claim 7, Okamoto does not expressly teach a restore module for restoring at least one parameter of the controlled system when said control parameter falls outside said pre-set tolerance range.

Sheirik teaches to a restore module for restoring at least one parameter of the controlled system when said control parameter falls outside said pre-set tolerance range (col. 21, lines 53-57).

Therefore, it would have been obvious to a person of ordinary skill in the art at the time of applicant's invention to modify the teaching of Okamoto to include a restore module for restoring at least one parameter of the controlled system when said control parameter falls outside said pre-set tolerance range to eliminate a human operator from real time control of the system (abstract and col. 5, lines 50-51), in addition to, reducing operator error, increasing long-term process control consistency, and eliminating the cost of an operator (col. 9, lines 55-57).

12. As per claim 9, Okamoto does not expressly teach said variation module is configured to detect a deviation, with respect to said tolerance range, of the difference between the current value of said control parameter and the respective mean value.

Sheirik teaches to said variation module is configured to detect a deviation (Fig. 32, element 3216), with respect to said tolerance range, of the difference between the current value of said control parameter and the respective mean value (col. 21, lines 47-52).

Therefore, it would have been obvious to a person of ordinary skill in the art at the time of applicant's invention to modify the teaching of Okamoto to include a said variation module configured to detect a deviation, with respect to said tolerance range, of the difference between the current value of said control parameter and the respective mean value to eliminate a human operator from real time control of the system (abstract and col. 5, lines 50-51), in addition to, reducing operator error, increasing long-term process control consistency, and eliminating the cost of an operator (col. 9, lines 55-57).

13. As per claim 10, Okamoto does not expressly teach said variation module is configured for operating according to a plurality of values of said control parameter, by detecting when a given number of said values of said control parameter falls outside said pre-set tolerance range.

Sheirik teaches said variation module is configured for operating according to a plurality of values of said control parameter, by detecting when a given number of said values of said control parameter falls outside said pre-set tolerance range (col. 21, lines 32-39 and 53-57).

Therefore, it would have been obvious to a person of ordinary skill in the art at

Art Unit: 2121

the time of applicant's invention to modify the teaching of Okamoto to include a plurality of values of said control parameter, by detecting when a given number of said values of said control parameter falls outside said pre-set tolerance range to eliminate a human operator from real time control of the system (abstract and col. 5, lines 50-51), in addition to, reducing operator error, increasing long-term process control consistency, and eliminating the cost of an operator (col. 9, lines 55-57).

14. As per claim 13, Okamoto does not expressly teach said characteristic parameters of the controlled system are chosen from the group consisting of:

- a current generated by said at least one fuel cell,
- a quantity of air supplied to said at least one fuel cell, and
- a temperature of said at least one fuel cell.

Sheirik teaches to characteristic parameters of the controlled system are chosen from the group consisting of:

- a current (Fig. 20, element 2002) generated by said at least one fuel cell,
- a quantity (Fig. 20, element 2002) of air supplied to said at least one fuel cell,
- and
- a temperature (Fig. 20, element 2002) of said at least one fuel cell (col. 7, lines 32-34).

Therefore, it would have been obvious to a person of ordinary skill in the art at the time of applicant's invention to modify the teaching of Okamoto to include characteristic parameters of the controlled system are chosen from the group consisting of: a current generated by said at least one fuel cell, a quantity of air supplied to said at least one fuel cell, and a temperature of said at least one fuel cell to eliminate a human operator from real time control of the system (abstract and col. 5, lines 50-51), in addition to, reducing operator error, increasing long-term process control consistency, and eliminating the cost of an operator (col. 9, lines 55-57).

15. As per claim 14, Okamoto teaches a method for controlling a system according to a deviation between an actual value measured on the system and a value estimated by means of a model of the controlled system of at least one control parameter, the method comprising:

generating the estimation of said control parameter implementing said model as a function of a set of characteristic parameters of the controlled system and of respective configuration parameters (col. 8, lines 29-33);

acquiring an actual value (Fig. 1, element 30, 30a, 34, 34a, 38, 38a, 40 and 40a), as measured on the controlled system, of a set of sensing parameters comprising at least one from among said control parameter and said characteristic parameters of the controlled system (col. 4, lines 25-32 and 36-52); and

wherein said controlled system comprises at least one fuel cell (col. 4, lines 4-14

and Fig. 1, element 20).

Okamoto does not expressly teach modifying said configuration parameters according to a set of updating data, generating an update-enable signal when said control parameter falls outside a pre-set tolerance range; calculating, according to the value of at least one of said characteristic parameters of the controlled system an address for storing said at least one control parameter and wherein said at least one control parameter is represented by a voltage generated by said at least one fuel cell.

Sheirik teaches to modifying said configuration parameters according to a set of updating data (col. 13, lines 1-13 and 24-31), generating an update-enable signal when said control parameter falls outside a pre-set tolerance range (col. 21, lines 32-39 and 53-57 and col. 9, lines 12-13); calculating, according to the value of at least one of said characteristic parameters of the controlled system an address for storing said at least one control parameter (col. 20, lines 39-61) and wherein said at least one control parameter is represented by a voltage (Fig. 20, element 2002) generated by said at least one fuel cell (col. 7, lines 32-34).

The specification does not disclose a definition of the term calculate, the examiner has interpreted the meaning of calculate as "to make for deliberate purpose: design" (The American Heritage College Dictionary, pg. 204). Sheirik teaches to the

limitation of calculating, according to the value of at least one of said characteristic parameters of the controlled system an address for storing said at least one control parameter, wherein the user specifies the data storage location for specific data.

Accordingly, it is inherent the module will have an analysis/determination component for placing the specific data in the appropriate data storage location as specified by the user.

Therefore, it would have been obvious to a person of ordinary skill in the art at the time of applicant's invention to modify the teaching of Okamoto to include configuration parameters according to a set of updating data, generating an update-enable signal when said control parameter falls outside a pre-set tolerance range; calculating, according to the value of at least one of said characteristic parameters of the controlled system an address for storing said at least one control parameter and at least one control parameter is represented by a voltage generated by said at least one fuel cell to eliminate a human operator from real time control of the system (abstract and col. 5, lines 50-51), in addition to, reducing operator error, increasing long-term process control consistency, and eliminating the cost of an operator (col. 9, lines 55-57).

16. As per claim 15, Okamoto does not expressly teach truncating the actual value of at least some of said characteristic parameters of the controlled system.

Sheirik teaches truncating the actual value of at least some of said characteristic parameters of the controlled system (col. 21, lines 41-43).

Therefore, it would have been obvious to a person of ordinary skill in the art at the time of applicant's invention to modify the teaching of Okamoto to include truncating the actual value of at least some of said characteristic parameters of the controlled system to eliminate a human operator from real time control of the system (abstract and col. 5, lines 50-51), in addition to, reducing operator error, increasing long-term process control consistency, and eliminating the cost of an operator (col. 9, lines 55-57).

17. As per claim 16, Okamoto does not expressly teach verifying whether the actual value, as measured on said controlled system, of at least one of said characteristic parameters of the controlled system falls within an allowed range of variation.

Sheirik teaches to verifying whether the actual value, as measured on said controlled system, of at least one of said characteristic parameters of the controlled system falls within an allowed range of variation (col. 21, lines 32-39).

Therefore, it would have been obvious to a person of ordinary skill in the art at

Art Unit: 2121

the time of applicant's invention to modify the teaching of Okamoto to include verifying whether the actual value, as measured on said controlled system, of at least one of said characteristic parameters of the controlled system falls within an allowed range of variation to eliminate a human operator from real time control of the system (abstract and col. 5, lines 50-51), in addition to, reducing operator error, increasing long-term process control consistency, and eliminating the cost of an operator (col. 9, lines 55-57).

18. As per claim 17, Okamoto does not expressly teach restoring at least one parameter of the controlled system when said control parameter falls outside said pre-set tolerance range.

Sheirik teaches restoring at least one parameter of the controlled system when said control parameter falls outside said pre-set tolerance range (col. 21, lines 53-57).

Therefore, it would have been obvious to a person of ordinary skill in the art at the time of applicant's invention to modify the teaching of Okamoto to include restoring at least one parameter of the controlled system when said control parameter falls outside said pre-set tolerance range to eliminate a human operator from real time control of the system (abstract and col. 5, lines 50-51), in addition to, reducing

operator error, increasing long-term process control consistency, and eliminating the cost of an operator (col. 9, lines 55-57).

19. As per claim 18, Okamoto does not expressly teach detecting a deviation, with respect to said tolerance range, of a difference between a current value of said control parameter and a respective mean value.

Sheirik teaches to a deviation, with respect to said tolerance range, of a difference between a current value of said control parameter and a respective mean value (col. 21, lines 47-52).

Therefore, it would have been obvious to a person of ordinary skill in the art at the time of applicant's invention to modify the teaching of Okamoto to include a deviation, with respect to said tolerance range, of a difference between a current value of said control parameter and a respective mean value to eliminate a human operator from real time control of the system (abstract and col. 5, lines 50-51), in addition to, reducing operator error, increasing long-term process control consistency, and eliminating the cost of an operator (col. 9, lines 55-57).

20. As per claim 19, Okamoto does not expressly teach operating according to a plurality of values of said control parameter, by detecting when a given number of said values of said control parameter falls outside said pre-set tolerance range.

Sheirik teaches to operating according to a plurality of values of said control parameter, by detecting when a given number of said values of said control parameter falls outside said pre-set tolerance range (col. 21, lines 30-39 and 53-57).

Therefore, it would have been obvious to a person of ordinary skill in the art at the time of applicant's invention to modify the teaching of Okamoto to include a plurality of values of said control parameter, by detecting when a given number of said values of said control parameter falls outside said pre-set tolerance range to eliminate a human operator from real time control of the system (abstract and col. 5, lines 50-51), in addition to, reducing operator error, increasing long-term process control consistency, and eliminating the cost of an operator (col. 9, lines 55-57).

21. As per claim 21, Okamoto does not expressly teach characteristic parameters of the controlled system are chosen from the group consisting of:

- a current generated by said at least one fuel cell,
- a quantity of air supplied to said at least one fuel cell, and
- a temperature of said at least one fuel cell.

Sheirik teaches to characteristic parameters of the controlled system are chosen from the group consisting of:

a current (Fig. 20, element 2002) generated by said at least one fuel cell,  
a quantity (Fig. 20, element 2002) of air supplied to said at least one fuel cell,  
and  
a temperature (Fig. 20, element 2002) of said at least one fuel cell (col. 7, lines 32-34).

Therefore, it would have been obvious to a person of ordinary skill in the art at the time of applicant's invention to modify the teaching of Okamoto to include characteristic parameters of the controlled system are chosen from the group consisting of: a current generated by said at least one fuel cell, a quantity of air supplied to said at least one fuel cell, and a temperature of said at least one fuel cell to eliminate a human operator from real time control of the system (abstract and col. 5, lines 50-51), in addition to, reducing operator error, increasing long-term process control consistency, and eliminating the cost of an operator (col. 9, lines 55-57).

22. As per claim 22, Okamoto does not expressly teach said functional module implements a function  $F(I_{sub.c}, Q_{sub.c}, T_{sub.c})$  that calculates, from discretized

values  $I_{sub. c}$ ,  $Q_{sub. c}$ ,  $T_{sub. c}$ , a memory address  $h$  in which to store a corresponding voltage value of  $V_{sub. h}$ .

Sheirik teaches to a functional module implements a function  $F(I_{sub. c}, Q_{sub. c}, T_{sub. c})$  that calculates, from discretized values  $I_{sub. c}$ ,  $Q_{sub. c}$ ,  $T_{sub. c}$ , a memory address  $h$  in which to store a corresponding voltage value of  $V_{sub. h}$ . (col. 20, lines 39-61).

The specification does not disclose a definition of the term calculate, the examiner has interpreted the meaning of calculate as "to make for deliberate purpose: design" (The American Heritage College Dictionary, pg. 204). Sheirik teaches to the limitation of a functional module that implements a function  $F(I_{sub. c}, Q_{sub. c}, T_{sub. c})$  that calculates, from discretized values  $I_{sub. c}$ ,  $Q_{sub. c}$ ,  $T_{sub. c}$ , a memory address  $h$  in which to store a corresponding voltage value of  $V_{sub. h}$ , wherein the user specifies the data storage location for specific data. Accordingly, it is inherent the module will have an analysis/determination component for placing the specific data in the appropriate data storage location as specified by the user.

Therefore, it would have been obvious to a person of ordinary skill in the art at the time of applicant's invention to modify the teaching of Okamoto to include a functional module implements a function  $F(I_{sub. c}, Q_{sub. c}, T_{sub. c})$  that calculates,

Art Unit: 2121

from discretized values  $I_{sub.c}$ ,  $Q_{sub.c}$ ,  $T_{sub.c}$ , a memory address  $h$  in which to store a corresponding voltage value of  $V_{sub.h}$ . to eliminate a human operator from real time control of the system (abstract and col. 5, lines 50-51), in addition to, reducing operator error, increasing long-term process control consistency, and eliminating the cost of an operator (col. 9, lines 55-57).

23. As per claim 23, Okamoto does not expressly teach said functional module implements a function  $F$  that identifies a bi-unique correspondence between an input set of characteristic parameters and the address.

Sheirik teaches to a functional module implements a function  $F$  that identifies a bi-unique correspondence between an input set of characteristic parameters and the address (col. 20, lines 39-61).

The specification does not disclose a definition of the term calculate, the examiner has interpreted the meaning of calculate as "to make for deliberate purpose: design" (The American Heritage College Dictionary, pg. 204). Sheirik teaches to the limitation of a functional module implements a function  $F$  that identifies a bi-unique correspondence between an input set of characteristic parameters and the address, wherein the user specifies the data storage location for specific data. Accordingly, it is

Art Unit: 2121

inherent the module will have an analysis/determination component for placing the specific data in the appropriate data storage location as specified by the user.

Therefore, it would have been obvious to a person of ordinary skill in the art at the time of applicant's invention to modify the teaching of Okamoto to include a functional module implements a function  $F$  that identifies a bi-unique correspondence between an input set of characteristic parameters and the address to eliminate a human operator from real time control of the system (abstract and col. 5, lines 50-51), in addition to, reducing operator error, increasing long-term process control consistency, and eliminating the cost of an operator (col. 9, lines 55-57).

24. As per claim 24, Okamoto does not expressly teach calculating an address comprises implementing a function  $F(I_{\text{sub. c}}, Q_{\text{sub. c}}, T_{\text{sub. c}})$  that calculates, from discretized values  $I_{\text{sub. c}}, Q_{\text{sub. c}}, T_{\text{sub. c}}$ , a memory address  $h$  in which to store a corresponding voltage value  $V_{\text{sub. h}}$ .

Sheirik teaches to calculating an address comprises implementing a function  $F(I_{\text{sub. c}}, Q_{\text{sub. c}}, T_{\text{sub. c}})$  that calculates, from discretized values  $I_{\text{sub. c}}, Q_{\text{sub. c}}, T_{\text{sub. c}}$ , a memory address  $h$  in which to store a corresponding voltage value  $V_{\text{sub. h}}$  (col. 20, lines 39-61).

The specification does not disclose a definition of the term calculate, the examiner has interpreted the meaning of calculate as "to make for deliberate purpose: design" (The American Heritage College Dictionary, pg. 204). Sheirik teaches to the limitation of calculating an address comprises implementing a function  $F(I_{\text{sub. c}}, Q_{\text{sub. c}}, T_{\text{sub. c}})$  that calculates, from discretized values  $I_{\text{sub. c}}, Q_{\text{sub. c}}, T_{\text{sub. c}}$ , a memory address  $h$  in which to store a corresponding voltage value  $V_{\text{sub. h}}$ , wherein the user specifies the data storage location for specific data. Accordingly, it is inherent the module will have an analysis/determination component for placing the specific data in the appropriate data storage location as specified by the user.

Therefore, it would have been obvious to a person of ordinary skill in the art at the time of applicant's invention to modify the teaching of Okamoto to include calculating an address comprises implementing a function  $F(I_{\text{sub. c}}, Q_{\text{sub. c}}, T_{\text{sub. c}})$  that calculates, from discretized values  $I_{\text{sub. c}}, Q_{\text{sub. c}}, T_{\text{sub. c}}$ , a memory address  $h$  in which to store a corresponding voltage value  $V_{\text{sub. h}}$  to eliminate a human operator from real time control of the system (abstract and col. 5, lines 50-51), in addition to, reducing operator error, increasing long-term process control consistency, and eliminating the cost of an operator (col. 9, lines 55-57).

25. As per claim 25, Okamoto does not expressly teach calculating an address comprises implementing a function  $F$  that identifies a bi-unique correspondence between an input set of characteristic parameters and the address.

Sheirik teaches to calculating an address comprises implementing a function  $F$  that identifies a bi-unique correspondence between an input set of characteristic parameters and the address (col. 20, lines 39-61).

The specification does not disclose a definition of the term calculate, the examiner has interpreted the meaning of calculate as "to make for deliberate purpose: design" (The American Heritage College Dictionary, pg. 204). Sheirik teaches to the limitation of calculating an address comprises implementing a function  $F$  that identifies a bi-unique correspondence between an input set of characteristic parameters and the address, wherein the user specifies the data storage location for specific data. Accordingly, it is inherent the module will have an analysis/determination component for placing the specific data in the appropriate data storage location as specified by the user.

Therefore, it would have been obvious to a person of ordinary skill in the art at the time of applicant's invention to modify the teaching of Okamoto to include calculating an address comprises implementing a function  $F$  that identifies a bi-unique

correspondence between an input set of characteristic parameters and the address to eliminate a human operator from real time control of the system (abstract and col. 5, lines 50-51), in addition to, reducing operator error, increasing long-term process control consistency, and eliminating the cost of an operator (col. 9, lines 55-57).

26. Claim 8 is rejected under 35 U.S.C. 103(a) as being unpatentable over Okamoto in view of Sheirik in further view of U.S. Patent No. 5,165,010 (hereinafter Masuda).

27. As per claim 8, Okamoto in view of Sheirik does not expressly teach said variation module comprises a timer with a count which can be activated when said control parameter falls outside said pre-set tolerance range and wherein said variation module is configured for emitting said update-enable signal when, once the count of said timer is through, said control parameter remains outside said pre-set tolerance range.

Masuda teaches to the use of a controller to force functional circuits (Fig. 2) to become activated when said control parameter falls outside said pre-set tolerance range and wherein said variation module is configured for emitting said update-enable signal when, once the count of said timer is through, said control parameter remains outside said pre-set tolerance range (col. 10, lines 67-68 and col. 11, lines 1-38).

Therefore, it would be obvious to a person of ordinary skill in the art at the time of the applicant's invention to modify the teaching of Okamoto in view of Sheirik to include the circuit of Masuda to implement a timer with a count which can be activated when said control parameter falls outside said pre-set tolerance range and wherein said variation module is configured for emitting said update-enable signal when, once the count of said timer is through, said control parameter remains outside said pre-set tolerance range to allow a neural network to be realized with an excellently high integration density (col. 2, lines 65-68 and col. 3, lines 1-2).

### ***Response to Arguments***

28. Applicant's arguments, see Remarks pgs. 8-9, filed 12 May 2006 with respect to claims 1-7, 9-10, 13-19 and 21 under U.S.C. 103(a) have been fully considered but they are not persuasive.

Claims 1-7, 9-10, 13-19 and 21 are rejected under U.S.C. 103(a) as unpatentable over Okamoto in view of Sheirik for reasons as set forth above. Furthermore, Okamoto in view of Sheirik teaches in claim 1, "wherein said acquisition module comprises a functional module for calculating, according to the value of at least one of said characteristic parameters of the controlled system an address for storing said at least one control parameter," (Sheirik: col. 20, lines 39-61); and in claim 14, "calculating, according to the value of at least one of said characteristic parameters of the controlled

system an address for storing said at least one control parameter," (Sheirik: col. 20, lines 39-61).

29. Applicant's arguments, see Remarks pgs. 9, filed 12 May 2006 with respect to claim 8 under U.S.C. 103(a) has been fully considered but they are not persuasive.

Claim 8 is rejected under U.S.C. 103(a) over Okamoto in view of Sheirik in further view of Masuda as set forth above.

### ***Conclusion***

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Jennifer L. Norton whose telephone number is 571-272-3694. The examiner can normally be reached on 8:00 a.m. - 4:30 p.m..

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Anthony Knight can be reached on 571-272-3687. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see <http://pair-direct.uspto.gov>. Should you
